

Drone Mapper — Assignment 3 High-Level Design

Authors: Sagi Eisenberg (207190406), Yoav Naaman (209543255)

TAU Advanced Topics in Programming (2026B). Assignment 3 splits the ex2 monolithic simulator into three separately built projects: a `simulator_207190406_209543255` executable that `dlopen`s `Algorithm_207190406_209543255.so` and `MissionControl_207190406_209543255.so`, then runs many missions in parallel under `-comparative` or `-competition` mode.

Artifact	Name
Executable	<code>simulator_207190406_209543255</code>
Algorithm plugin	<code>Algorithm_207190406_209543255.so</code>
MissionControl plugin	<code>MissionControl_207190406_209543255.so</code>

Plugin / UserCommon **namespaces** (code): `algorithm_207190406_209543255`, `mission_control_207190406_209543255`, `user_common_207190406_209543255`.

Folder responsibilities

Folder	Role	Build artifact
<code>common/</code>	Course-published interfaces used by more than one project. Read-only — we do not modify it.	none (INTERFACE lib <code>common::common</code>)
<code>Simulator/common_simulator/include/Simulator/</code>	Course-published interfaces used only by the Simulator	<code>Simulator/</code>
<code>Simulator/{include,src}/Simulator</code>	Course-published implementation	<code>simulator_207190406_209543255</code> executable
<code>MissionControl/common_mission_control/include/MissionControl/</code>	Course-published <code>IDroneControl</code>	<code>MissionControl/</code>

Folder	Role	Build artifact
MissionControl/{include,src}/	Our mission control implementation	MissionControl_207190406_209543255.so
Algorithm/{include,src}/	Our mapping algorithm	Algorithm_207190406_209543255.so
UserCommon/	Our code needed by more than one project. No build file — sources compile into each consumer.	none

The course staff placement rule: mocks and world simulation live in `Simulator/` because they would be replaced by real hardware APIs in production; mission control and the mapping algorithm live in their respective plugin projects. Shared cross-boundary interfaces stay in `common/`; simulator-only interfaces stay in `Simulator/common_simulator/`.

Main components

- **main (Simulator/src/main.cpp)** — Parses CLI via `parseSimulationCliArgs (SimulationCliArgs)`, creates the timestamped output directory with `createOutputDir`, loads the composition YAML, loads plugins through `PluginLoader`, builds one `SimulationRunFactoryImpl` per plugin binding, invokes `runPluginMatrix(bindings, composition, output_root, num_threads)` (`expandRunMatrix` runs inside that call), writes reports via `writeModeReport` → `writeComparativeReport` / `writeCompetitiveReport` plus per-plugin `writeSimulationOutputYaml`, then destroys plugin objects and calls `PluginLoader::unloadAll()` before return.
- **SimulationCli / SimulatorPaths (Simulator/io/SimulatorPaths.h)** — `parseSimulationCliArgs` returns `SimulationCliArgs`. Path helpers: `createOutputDir` (fresh `comparative_results_<UTC>` / `competition_<UTC>` folder) and `errorLogPathFromOutputMap` (derive `<plugin>_run_NNNN_error.log`).
- **YamlConfigParsers (Simulator/io/YamlConfigParsers.h)** — Five parsers: `parseCompositionFile`, `parseSimulationConfig`, `parseMissionConfig`, `parseDroneConfig`, `parseLidarConfig`. Parse failures are logged immediately through `RunErrorLog` / `IRunErrorLog`.

- **SimulatorReports** (`Simulator/io/SimulatorReports.h`) — `writeComparativeReport`, `writeCompetitiveReport`, `writeSimulationOutputYaml`. `writeModeReport` in `main.cpp` picks the mode writer.
- **PluginLoader** — `dlopen`s each `.so` once on the main thread (`loadAlgorithmSo`, `loadMissionControlsFromDirectory`, or the competitive-mode equivalents). Handles are `DlHandle (unique_ptr<void, DlCloser>)`. After each successful load it takes the factory registered by the plugin's static constructor into a `LoadedAlgorithmPlugin` / `LoadedMissionControlPlugin`. Access is `algorithmCount` / `algorithmAt` (and the mission-control equivalents) — no `algorithms()` vector getter. Never reloads a path already held open. `unloadAll()` drops factories then `dlclose`s every handle.
- **PluginRegistrar** — Simulator-owned singleton. `MappingAlgorithmRegistration` / `MissionControlRegistration` objects (defined in registration headers, `.cpp` in Simulator only) call `setPendingAlgorithmFactory` / `setPendingMissionControlFactory` during `dlopen`; the loader immediately `takePending*Factory()` so each registration is consumed exactly once. Factory aliases are `MappingAlgorithmFactory` / `MissionControlFactory`.
- **runPluginMatrix** — Free-function module (`RunMatrixOrchestrator.h`). Expands a composition into a flat `MatrixCell` list via `expandRunMatrix` (`simulation × mission × drone × lidar`) **inside** `runPluginMatrix(bindings, composition, output_root, num_threads)`, then runs every cell for every plugin binding. Pre-sizes the result table; each slot is written exactly once.
- **distributeWork** — Free-function scheduler. `num_threads` absent or 1 → main thread only. `N >= 2` → up to `N` worker threads (capped at cell count); main joins. Wraps per-cell work in `try/catch` so a plugin throw cannot terminate the process.
- **SimulationRunFactoryImpl** — Implements `simulator::ISimulationRunFactory`. Loads hidden and output `Map3DImpl` instances, constructs `MockGPS`, `MockLidar`, `MockMovement`, creates fresh plugin instances from the loaded factories, wires `MissionControlDependencies` / `MappingAlgorithmDependencies`, and returns a `SimulationRunImpl`.
- **SimulationRunImpl** — Implements `simulator::ISimulationRun`. Calls `missionControl->runMission()`, saves the output map, scores with `compareMaps(hidden, output, spawn)` against the hidden map, and returns `SimulationResult`. Per-run `RunErrorLog` path comes from `errorLogPathFromOutputMap`. Contains exceptions from `runMission()` so a single bad run scores `kErrorScore (-1)` without aborting the matrix.
- **Mocks + maps + scoring** (`Simulator/src/`) — `Map3DImpl` (hidden + output), `MockGPS`, `MockLidar`, `MockMovement` (holds the hidden map;

throws on wall/boundary collision), `compareMaps`. `makeMap3D` is src-only (`Map3DNpy.h`).

- **MissionControlImpl_207190406_209543255** — Plugin entry point implementing `common::IMissionControl`. Creates `DroneControlImpl`, loops `step()` until the mission finishes or hits max steps, returns `MissionRunResult`.
- **DroneControlImpl** — Implements `mission_control::IDroneControl`. Each step carves the drone footprint (`markDroneFootprintEmpty`) before `nextStep`, then executes movement. `applyScanIfRequested` still runs after a recoverable `Continue` when the command carries `scan_orientation`. Finished algorithm status skips move/scan; over-limit or unsupported commands return `Error`.
- **MappingAlgorithmImpl_207190406_209543255** — Plugin entry point implementing `common::IMappingAlgorithm`. Reads the world through `const common::IMap3D&` only. Uses `WavefrontPlanner`, which composes `MappingAlgorithmFrontier` and calls `PathShaping` / `ScanPlanning` to produce an `ExplorationPlan`, then emits movement plus a score-aware scan toward that cluster. Scan templates are `ConeTemplateCache` / `VoxelStamp`.
- **SimulationCoordUtil** — Shared world/voxel helpers: `worldInitialDronePosition`, `forEachSphereSample`.
- **SimulationImpl** — Implements published `simulator::ISimulation`. Constructor takes one `ISimulationRunFactory&`, the plugin filename used in per-run map names, and `num_threads`. `run(composition, output_path)` delegates to `runPluginMatrix` for that single binding and returns `SimulationManagerReport`. Comparative/competitive CLI, plugin folders, and aggregate YAML still live in `main` — `ISimulation::run` cannot express mode or a plugin set.

Sequence: one comparative cell

Comparative mode fixes one algorithm .so and varies every MissionControl .so in a folder. main parses CLI, creates the output dir, parses the composition (nested parseSimulationConfig / parseMissionConfig / parseDroneConfig / parseLidarConfig), loads plugins, takes pending factories, and builds one SimulationRunFactoryImpl / PluginMatrixBinding per plugin. runPluginMatrix expands the full cell list once, then one distributeWork call covers the whole plugin × cell matrix. Per-run RunErrorLog is opened from errorLogPathFromOutputMap before runMission(); startup errors skip the mission and score kErrorScore. After runMission() the output map is saved before compareMaps. Reports are writeSimulationOutputYaml per plugin, then writeModeReport / writeComparativeReport.

```

Competition mode is the mirror image: one `MissionControl` .so is fixed and every algorithm in a folder is varied; the same `runPluginMatrix` / `factory` / `run` path applies (`writeCompetitiveReport` instead of `writeComparativeReport`).

Sequence: DroneControl step loop

Inside `MissionControlImpl_207190406_209543255::runMission()`, each iteration calls `DroneControlImpl::step()`. Each step carves the drone footprint, then invokes `nextStep` once. `AlgorithmStatus::Finished` returns `Completed`

with no move or scan; over-limit or unsupported commands return **Error**. Otherwise an optional movement runs, then at most one scan if the command carries **scan_orientation** (including after a recoverable **Continue**), matching the published movement → scan → fuse contract.

    DC->>Algo: nextStep(state, latest_scan)
    Algo-->>DC: MappingStepCommand
    alt AlgorithmStatus::Finished
        Note over DC: no further move/scan
        DC-->>MC: Completed
    end

```

```

else over-limit / Error
    Note over DC: no move/scan
    DC-->>MC: Error
else Continue
    alt recoverable wall throw from Move
        DC->>Move: advance/elevate
        Move-->>DC: throw std::runtime_error
        DC-->>DC: Continue
    else normal movement
        DC->>Move: rotate/advance/elevate
    end
    opt command has scan_orientation
        DC->>Lidar: scan(orientations)
        DC->>SR: applyScanToMap
        SR->>Map: set voxels
    end
    DC-->>MC: Continue
end
end
end

```

Recoverable collision handling: `MockMovement::advance / elevate` detect wall/boundary collisions against the hidden map and **throw** `std::runtime_error` (they never return a failed `MovementResult` for that case). Pre-throw limit checks in `MockMovement` return `{false, message}` when a command exceeds `max_rotate / max_advance / max_elevate`. `DroneControlImpl` catches the exception and any failed `MovementResult` and returns `DroneStepStatus::Continue`. `applyScanIfRequested` still runs after that `Continue` when the command carried a `scan_orientation`.

Backstop at the run boundary: Non-recoverable exceptions propagate out of `DroneControlImpl::step()` through `runMission()`. `SimulationRunImpl::run()` wraps the entire `runMission()` call in `try/catch`, logs the error, still saves the partial output map when possible, assigns score `kErrorScore (-1)`, and lets the run matrix continue.

Threading

CLI	Behavior
<code>num_threads</code> absent	Main thread runs all cells
<code>num_threads=1</code>	Main thread runs all cells
<code>num_threads=N</code> ($N \geq 2$)	Up to N worker threads plus the main thread (workers capped at cell count)

All `.so` files are loaded on the main thread before workers start. Each matrix cell creates fresh plugin instances via the stored factories — instances are never

shared or cached between runs. The result table is pre-allocated; workers write disjoint indices with no mutex on the table itself. Aggregate YAML reports are written on the main thread after all workers join. `.so` handles are not `dlclose`d from worker threads.

Data and maps

Each run owns two `Map3DImpl` instances:

- **Hidden map** — Loaded from the simulation config `.npz`. Wired into `MockLidar` and `MockMovement` only. Never exposed to plugins.
- **Output map** — Created empty (or from mission resolution settings). Passed to `DroneControlImpl` as `IMutableMap3D`; mission control writes lidar fusion here.

The algorithm receives `const common::IMap3D&` through `MappingAlgorithmDependencies` and reads voxel occupancy for planning only — it never mutates the map. All scan writes go through `DroneControlImpl` → `applyScanToMap` → output `Map3DImpl`.

After the mission, `SimulationRunImpl` saves the output map then calls `compareMaps(hidden, output, spawn)` to score it. World <-> voxel conversion and axis offsets are centralized in `user_common_207190406_209543255::SimulationCoordUtil` (`worldInitialDronePosition, forEachSphereSample`).
